THE FIRST VENEZUELAN COFFEE COFFEE

1830–1855

One of the most difficult problems encountered by students of the post-independence period of Spanish American history is the lack of reliable economic history for this era. Clearly, the development of local and regional economies after the close of the wars for independence shaped the course of political, social, and diplomatic history in the new American republics. In many parts of Latin America, patterns of economic, political, and social behavior set during the first generation of independence would last out the nineteenth century.

Few new-born republics demonstrated this characteristically close relationship between economics, politics, and society as clearly as Venezuela. Liberated from Spain through a heroic continental struggle led by Simón Bolívar, Venezuela helped form the Liberator’s dream republic of Gran Colombia in 1821. During the next decade most Venetueans were occupied in reestablishing their war-ravaged economy, supporting, however reluctantly, Bolívar’s far-off military campaigns, and struggling to make the cumbersome and highly unstable confederation of Gran Colombia viable. But once Venezuela’s flanks were secure, General José Antonio Páez, took his country out of Gran Colombia in 1830, agriculturalists, commercial agents, and bankers turned their full energies to exploiting a booming economy. Under the watchful eye of General Páez, the country prospered amidst its newfound political tranquility. Rising coffee prices and easy credit helped the Conservative Party supporting

AGRICULTURAL HISTORY

General Páez to keep the peace and encourage progress. But during the late 1840s declining coffee prices and rising interest rates ended this politically stable and socially tranquil period. Along with the collapse of the coffee economy came the disintegration of the Conservative coalition and its replacement by a faction-ridden Liberal Party is 1848. Unable to govern effectively or to keep the country peaceful by force, the Liberal government struggled vainly with power until a full-scale civil war broke out in 1858, initiating a new cycle in Venezuela's political and economic history. In retrospect the years 1830 to 1850, which encompass the rise and decline of the first coffee cycle, appear critical for the political and social development of Venezuela in the nineteenth century. Although many political and social forces of the late nineteenth century had their origins in the colonial period, or received their directions during the independence era, it was during the first coffee boom that they found their shape and mode of operation. It is, for example, extremely difficult to understand the abolition of slavery in 1854 without a clear notion of the causes and effects of the coffee cycle which preceded it. Yet to attempt an analysis of the development of Venezuela's domestic economy during this period is risky. Not only are there few reliable monographs to guide one through the confusion of the periodical press, but the basic statistical series on population, exports, imports, and the like have yet to be compiled. Nonetheless, with the aid of the reasonably reliable Memorias of the Departments of the Interior and of the Treasury, and the often perceptive contemporary analyses of the state of the nation, a relatively accurate outline of the structure and development of the Venezuelan economy can be obtained.

Throughout the period under consideration Venezuela had a model agri-cultural export economy. With almost no native manufactures, she produced

6 Little indeed has been written analyzing Venezuelan economy during this period with the exception of the relevant chapters in Environment in Latin America. The most helpful Venezue-la authors have been in the genre of the interpretative historical essay. See Carrera Danne, The lessons of history (Caracas: U.C.V., 1958); and Brito Figueroa, Ensayo de historia social venezolana (Caracas: U.C.V., 1960).

6 The statistical information on population and exports used for this article comes from a set of preliminary tables included in the Appendix of a forthcoming book by John V. Lombardi, The Decline and Abolition of Negro Slavery in Venezuela, 1820-1854 (Westport, Conn.: Greenwood Publishing Corp., 1971). These tables are designed primarily to show the relative orders of magnitude involved.
VENEZUELAN COFFEE CYCLE 1830-1855

During the late 18th century, Venezuela's coffee economy boomed, driven largely by the proximity of the country to the French market. However, after the French Revolution, the demand for coffee from France declined, leading to a significant drop in the coffee industry. It was not until the 19th century, particularly the 1830s, that Venezuela experienced a significant revival of its coffee economy. This period is often referred to as the "coffee boom," as exports of coffee doubled from 1830 to 1840. The coffee industry continued to grow, reaching its peak in the 1850s, before declining again in the late 1850s due to various factors, including disease and over-exploitation of the land. Despite this, the coffee industry in Venezuela remained a significant contributor to the country's economy for several decades.
Not only were the trees expensive, but they took about six years to begin producing coffee. Coffee, on the other hand, appeared much more attractive. In addition to producing a marketable crop within three years of planting (half the time required by cacao), coffee could be planted at up to four times the density. Although producing only one harvest a year, each unit of land could generate up to twelve times more income when planted in coffee as when planted in cacao. Given these conditions, plus an expanding world market in coffee which kept prices high for a time, the decision to plant coffee is not surprising. An additional encouragement to expansion was the fact that, beginning in the late 1820s, planters found it relatively easy to borrow the capital necessary to establish a plantation and maintain it for a number of years, albeit at extremely high interest rates.

The boom which lasted almost until 1840 was extraordinary from almost every point of view. The export figures show that, while the total quantity of cacao exported grew very slowly between 1830 and 1840, the production of coffee doubled and then almost tripled in the same period. Such unprecedented growth had profound effects on all aspects of Venezuelan society and economy. Traditional relationships between capitalists, workers, commercial factors, planters, and government could not withstand both the onslaught of war and the exposure to the dynamics of rapid economic expansion.

Traditionally, investment capital for Venezuelan agriculture had come from three major sources: Spanish capitalists, the Venezuelan rich, and the Church. But the wars for independence ended these relationships. By the end of the eighteenth century, large-scale Spanish investment in Venezuela was over, and the remaining individual capitalists were effectively destroyed or driven out by the war. Meanwhile, the same sort of calamities that forced planters to borrow money in the post-war era also ruined or blocked most of the Church’s sources of capital. Before the war the Church had invested most of her resources in agri-

13 There is an excellent chart included in a treatise by Agustín Cardozo on Venezuelan political and economic geography that shows relative migration rates, yields, and similar information. For Venezuela’s major crops during the late 1830s: Agustín Cardozo, Obra completa (Caracas: Ministerio de Educación, 1960), 1: 134–155.

14 Of course this income producing estimate is based on coffee prices during the 1825–1835 decade which proved to be higher in relation to cacao prices than they would be later on in the 1840s and 1850s. Cardozo, Obra completa 1: 134–135 and see n. 15, supra.

16 See the export figures in Histamérica, 1833–1836, Memoria en opos, n. 6.

17 See Brito Figueroa, La estructura económica de Venezuela endem (Caracas: U.G.V., 1983), pp. 285–308. Also revealing are the nostalgic commemorations of land-granted planters about the happy days of Church-dominated credit and limited casco factura. El Venezolan, 13 April 1844, No. 258. For an example of Church operations of this kind see Covarrubias, Church Wealth in Mexico.

VENEZUELAN COFFEE CYCLE 1830-1855

329

culture. Ganar, obras plás, capellanías, and other holy loans were widely distributed among Venezuelan planters, and as their fortunes declined so did the Church’s. In equally bad shape, Church-owned and administered properties added little or no revenue to the priestly coffers.13 Given the rate of expansion between 1825 and 1846, it appears that the Church was never in a position to contribute the large sums needed to support such a boom.

The credit vacuum existing in Venezuela soon after the war quickly filled with European and American speculators with an eye on the high prices of coffee and the desperate straits of the local planters. Evidently there was no lack of capital during these years, but the interest rates were phenomenal. In the late 1820s planters commonly paid two or three percent a month, although by the end of the 1830s this had fallen to around one percent a month.14 A mere subtle danger for the planter lay in a change in the terms of credit. Long accustomed to the long-term, low-interest agricultural credit supplied by the Church, the planters were ill equipped to handle the intricacies of short-term, high-interest commercial credit extended by the exporters and their agents. Since the primary sources of capital, banks and commission houses, wanted loans that could be paid off in a year or less, most planters found themselves in the disagreeable position of having to deal with middlemen. Naturally, this raised the cost of money still higher as the middlemen took their cut.15 Yet so desperate were Venezuelans for money that agricultural, cattle raising, and commercial interests joined together to remove all the restrictions on moneylenders imposed by Spanish legal tradition. As an inducement to foreign investors, the legislators voted to eliminate the protection Spanish law had placed around the debtor to guard him against exploitation by avaricious capitalists. This farsighted law, cursed and praised throughout the Páez era as the Ley de 10 de abril de 1834, showed the amount of political control gained by the

13 Churchmen were forever bemoaning the decline of their terrenal goods. AGN 4 (1822): 190-195; 167 (1823); 31; Representación dirigida al sobrenombre Congreso sobre que se reduzca los réditos de los cenos consagrados al consumo y medio perteneciente (1831) in Sociedad Económica de Amigos del País, Memorias y Estudios, 1829-1839 (2 vols., Caracas: Banco Central de Venezuela, 1936), 1: 141-152; El Apostol Venezuela, 10 January 1832, No. 8; See also Archivo Arquidiocesano, Obra Pía, caperita 1; 1828; and Eduardo Arcila Parias et al., La Obra Pía de Chacao, 1809-1855 (Caracas: U.G.V., 1946), p. 1.

14 It is extraordinarily difficult to chart the fluctuations of interest rates. While the material for such a task exists in such places as the Registro Principal de Casas and the Archivo Arquidiocesano, the organization and analysis of these widely scattered data is a job for a trained economist or economic historian armed with the might of computer technology. Nevertheless, it is possible to glean enough information from the contemporary periodical press to hazard an interpretation of the trends. The one percent per month figure is probably what planters paid for their money; merchants and moneylenders were likely paid less. See, supra, in addition to the sources in n. 14, La ley de 10 de abril y el comercio de Venezuela (Valencia: Biblioteca Valdés, 1838); La Revista Neuronal, 18 September 1838, No. 60; El Promeo, 13 May 25 June 1843, Nos. 4 to 50; El Agricultor, 21 February 1844, Nos. 1; Guerra de Venezuela, 14 November 1847, No. 888; PRO, FO 80/22, 86-87 (Beloff H. Wilson, Caracas, 13 March 1844); FO 80/25, 151 (Beloff H. Wilson, Caracas, 20 April 1845).

commercial-mercantile elite under the first years of the Conservative Oligarchy’s rule.21

Nor were the legislative triumphs of the commercial elite limited to the 10 de abril law. Although this law allowed any rate of interest under any conditions, a special court was doomed to perceive in those of commercial and financial claims. An international tribunal, created in 1826, had special jurisdiction over economic cases and followed few of the formalities usually prevalent in courts of law.22 Safely ensconced behind this legal barricade, the commercial sector created a National Bank in 1841 at the height of the coffee boom to help in their financial transactions and to handle the handling of the federal government.

This series of legislative victories testifies eloquently to the political ascendancy of the commercial elite as well as to the necessity and optimism of Venezuelan planters. As long as the high price of coffee continued, and barring political calamities, the planters believed they could get out from under their high debts. As the same token the money-lenders willingly extended, renegotiated, or increased loans as long as the export market held up. But the happy merry-go-round of debts, expansion, and high interest rates could not last forever. By the end of the 1830s numerous cracks began to appear in the foundations of the coffee boom. About 1840, planters began to feel the squeeze of their creditors as coffee prices sagged and loans were called in.23 When a planter could not make good on his obligations or renegotiate the debt, the provisions of the 10 de abril law went into effect, and his goods, land, or slaves were sold at public auction. This arrangement was not very satisfactory for the planter, since he generally lost his assets for the amount of his debt.24

This type of transaction helped bring about a profound division in Venezuelan society between those who identified with the agricultural interests and those who sided with the commercial-mercantile elite. The split was symbolically formalized in 1840 when the planters helped found El Venezolano, edited by Antonio Leocadio Guzmán, and then organized the Liberal Party later in the same year. Originally concentrating on a change of leaders in the government, the party soon became more concerned with the economic crisis that gripped the nation; particularly the agricultural sector, in the years after 1842. Meanwhile, the Conservatives concentrated on keeping their privileges and control.25

When crisis struck in 1842 and planters found themselves overextended, each individual quickly enlisted in the ranks of those leaders who promised a way out of his dilemma. Naturally enough, no one, planter or financial oligarch, wanted

to acknowledge himself responsible for his own problems. Prominent publicists vied with one another in analysing the causes of and remedies for the crisis. There were three major areas of the economy which contributed most to the severity and duration of the crisis: production, labor, and credit.

During the decade of the 1830s Venezuelan planters, obsessed by the single-minded mania of coffee expansion, operated so energetically that between 1830 and 1842 coffee production almost tripled. Such a massive increment in exports of this vital crop reflected an equally massive commitment of capital and labor to the clearing, planting, and harvesting of new coffee plantations. Although some of the growth in the export figures can be traced to the substitution of coffee for cacao on already cleared land, or to the more intensive cultivation of existing plantations, most of it probably represented new plantings in new areas. This is clarified by the export figures for cacao during the boom period. Had the planters conducted an energetic campaign of extorsion from cacao to coffee we could expect to see a rapid decline in the quantities of cacao exported. But nothing of the kind occurred, and in fact cacao production registered a slight increase during this period. Since cacao was grown at much the same altitude-temperature combination as coffee, it seems safe to assume that most of the coffee growth came from new establishments on virgin land.

Nor does it appear accurate to attribute much of the expansion to improved methods or denser plantings in the coffee fields. Venezuelan planters were very slow to adopt new methods or employ new tools. The series of newspaper articles advocating improvements in pruning, fertilizing, planting, and harvesting contained the same ideas which had been advocated in the twenties. Moreover, denser planting was a self-defeating method of expansion, since the yield of a coffee plantation declined in quantity and quality if the trees were crowded too closely together.

Since heavy investments in land, trees, and labor usually implied heavy planter indebtedness, the only way for a coffee baron to meet his financial obligations was to produce more and more coffee. However, at the end of each cycle of borrowing and planting, the planters found themselves in as much debt as before since coffee prices declined slowly through the boom period.

The price decline was the natural result of increased production by the major exporters—Brazilian, Ceylonese, and Venezuelan exports all expanded at roughly...
the same rate—39 coupled with slowly growing demand in the United States and Europe, where panics and depression slowed income growth. If the price declines did not completely bankrupt him, the planter typically reacted by seeking new loans in an attempt to expand production still more,34 but new production only contributed to further declines in coffee prices.

This extensive expansion also brought a rise in costs. As the boom decade progressed, most of the readily accessible land came under cultivation, and planters had to go further afield to find suitable undeveloped land. Once outside the traditionally cultivated areas they had to contend with Venezuela’s absurdly bad roads. In answer to their complaints, Congress studied many projects for roads, but none of them was backed by sufficient interest or cash to become a reality. Thus, while the price of coffee declined, planters saw much of their diminishing margin of profit cut still further by rising transportation charges. When the sharp drop in coffee prices occurred in 1842, the rest of the planters’ profit probably disappeared, and the cycle of expansion had to end.32

At the beginning of the boom, plantation workers were easy to find. The relative stability established and guaranteed by the Pérez regime, plus the return of discharged soldiers, encouraged better organization of rural labor. More importantly, prices found planters willing to pay well on the basis of the high price of coffee and rural laborers found it advantageous to trade their work for the wages offered by planters than to remain occupied in subsistence agriculture. Since coffee production is a seasonal operation, the growers needed large numbers of workers only at harvest time. For the duration of the growing season, a smaller maintenance crew was all that could be kept busy with the cleaning and pruning operations. With a large floating work force readily available, few planters worried much about labor problems.33

As coffee production soared and more land came under cultivation, a larger percentage of the labor force became occupied with maintenance, which reduced the men available for seasonal harvest work.34 In addition, falling coffee prices made it less to their plantations more than could burst of interest in the late third

41 It is difficult to get an accurate estimate of transportation costs. But See Forastier doubts that the rising cost of transportation hurt the planters. See Lander, fragmento Semana, “A los ciudadanos de la provincia de Venezuela” in Venezuela política 6: 174-181; El Liberal, 22 July 1842, No. 867; Instituto de Estudios Industriales (Caracas: George Conner, 1845); PRO, FO 80/14, 36 (D. F. O’Lough, Caracas, 22 February 1841).
42 Planters were most satisfied with their workers. However, complaints registered during boom times were major about behavior, not shortages or excessive cost. Caracas, 1831, Memorias sobre la materia de labor y contratación, Parte I, 52; and Caracas, 1839, Memorias sobre la materia de labor y contratación, Parte I, 52.
43 The increase of this shift was the increasing scarcity of foodstuffs as laborers became more occupied in commercial agriculture and spent less time on the production of food crops. U.S. Dept. stat., Consular 4: No. 84 (R. Reinhart, La Guaira, 12 March 1837); 4: No. 94 (B. Reinhart, La Guaira, 12 January 1841).
prices made it harder for planters to attract any but the most temporary workers to their plantations, since they could no longer afford to pay the pesos much more than could be made in subsistence agriculture.39 This explains the sudden burst of interest in labor problems evidenced by planters and their supporters in the late thirties and through the forties.39 In an attempt to control their labor force, planters devised codes of conduct which, if enforced, would have controlled the rural worker's every movement. Unfortunately for the planters, Venezuela’s police force was so inefficient that almost none of the elaborate ordinances actually affected the pesos.39 And though provincial legislatures might pass and repass restrictive labor rules, no one could push through a law that would improve the conditions and wages of plantation peons—the only remedy with any possibility of success.34 As the commercial agricultural sector shifted from overpopulation to under-population in the late 1850s, the Congress and the Department of the Interior became more and more interested in the possibilities of immigration.39 Venezuela's population grew only twenty-five percent in the decade of expansion, and many statesmen saw immigration as the answer to labor shortages. Unfortunately, Venezuela had little to offer prospective citizens, and government support of immigration remained limited.40 By and large most of the immigration to Venezuela in this period came from Spanish possessions, particularly the Canary Islands, and these immigrants were more interested in commerce than in agriculture.46 Ner was the decadent institution of slavery any help to the labor-hungry planters. In Venezuela slavery had reached its peak in the late

AGRICULTURAL HISTORY

eighteenth century and was on the wane at the time of the wars of independence. As a result of the military necessities of the war, Venezuela's founding fathers abolished the slave trade, and later, in 1821, they assured the eventual extinction of slavery by passing a free-birth law. In any event, slaves and free-born slave children could not have exceeded four or five percent of the population in the period under discussion. This could have had only a relatively small impact on the agricultural fortunes of the country.41

Although planters had difficulties enough coping with labor problems and land shortages, even these were secondary when compared to the credit squeeze that set in with the crisis. Since the entire coffee boom depended on credit for its existence, restrictions on the amount of money available or any rise in the rates of interest were bound to wreak havoc among planters mortgaged far beyond their ability to pay. Throughout the boom period, and particularly in the early years, credit was readily available although at high interest rates, but, as the country stabilized and coffee production soared, interest rates fell from one or two percent monthly to about nine percent yearly between 1830 and 1840.44 Nevertheless, as planters never tired of pointing out, few agricultural enterprises could boast of returning even six percent a year on capital invested.45

Consequently, most planters were heavily in debt to commissary houses, financial middlemen, the Church, or all three. Counting on consigned coffee prosperity, growers evidently placed their hopes for economic survival on the income from increased plantings. But as prices declined slowly throughout the late 1830s, the average planter's margin of profit declined as well. In hopes of postponing the inevitable, planters borrowed more money to make more plantings or to pay off insistant creditors, thereby increasing their debt.46 When the crisis of 1842–1843 occurred, these hasty advances were in trouble as creditors began calling in loans and demanding payment of back interest. When payment was not forthcoming, the moneylenders put their cherished debt laws into effect and auctioned off the delinquent's property.47 Planters besieged the federal government for some kind of relief or protection, but that body, long dominated by the financial elite, appeared to have little interest in bailing out the desperate planters.48

42 See supra n. 14 and 15.

43 See for example the crisis of articles on interest rates in El Princeton, 13 May to 26 June 1843, Nos. 4 to 10. See also El Princeton, 9 May 1843, No. 17; El Agricultor, 13 March 1844, No. 4. However there is some evidence that El Princeton placed the cause of agricultural distress to stay up: it will suggest British Colonial Bank operating in Caracas. PBO, PO 80/25, 84–91 (R. H. VENEZUELAN COFFEE CYCLE 1830-1855

Each group affected by the crisis of 1842-1843 developed elaborate schemes for economic recovery. Analyses of the causes of depression reflected rather clearly the analyst's interests. The moneylenders saw the sloppily management, extravagance, and improvidence of the majority of agriculturalists as the cause of crisis. They maintained that the planters had made their contracts with capitalists with open eyes and, if they now were unable to fulfill their obligations, they had no one but themselves to blame. In any case, a short crisis was probably a good thing, since it tended to weed out the weak planters and would serve eventually to strengthen the economy.

Such equanimity in the face of crisis was not shared by the hacendados. They clearly identified the major cause of trouble with the high cost of money and the ruthless methods of moneylenders, sanctioned by the iniquitous 10 de abril law. Although admitting that some farmers might have agreed to loans with interest far beyond their ability to repay and acknowledging the extravagance of a very few planters, the agricultural bloc claimed that the vast majority of coffee growers were honest, hardworking, frugal, and fine-hearted men. Such an exemplary group could hardly have brought the crisis on itself; the blame could be laid on the parasitic class of moneylenders and their puppet government. While the agriculturalists produced the cross that made Venezuela rich, the answers collected all the money and took no risks. Equally incompatible projects for stimulating recovery were proposed by the two groups. The Conservatives, firm believers in liberal-economic doctrines, called for belt tightening and government aid to road building and immigration, which they felt would secure the long-term prosperity of Venezuela. By leaving intact the enlightened free credit laws, Venezuela would maintain an attractive place for the foreign investment so necessary for her development.

The planters said that roads and immigration were fine, but more direct and drastic measures were necessary to deal with the crisis. Since they believed the major illness of Venezuelan agriculture was financial rather than structural, the most effective remedies would be those aimed at changing the financial climate. First they proposed repeal of the law of 10 de abril, as it legalized the worst forms of extortion and exploitation under the guise of freedom of contracts. Once the money power lost its stranglehold over the country, adequate credit laws could be passed regulating the amount of interest legally collectible. Even these reforms would have little effect on the immediate predicament of the only productive class in society; what all growers needed more than anything else was money—money to employ peasants to harvest their crops, money to tide them over until the price of coffee turned upward, but most of all money at a low interest rate so the planters could get out of their credit bind. The best plan, the growers thought, would be to establish an agricultural credit institution which would provide capital by foreign loans guaranteed by the nation. Since few agricultural enterprises made more than six percent on their capital, loans

46 El Liberal, 19 July and 22 July 1842, Nos. 566 and 567; 31 January 1846, No. 581; 4 July 1846, No. 595.
47 See the articles in El Venezolan and El Agricultor as well as the issues by Tomas Lander and Fernando Toor previously cited.
48 Conservative views are found principally in the columns of such papers as El Liberal.
to farmers should be fixed at six percent interest per year and should be available only to those with agricultural properties to mortgage. According to its proponents, this scheme would be self-supporting, since agriculture was a good investment at six percent.\textsuperscript{32}

The Conservators called the plan special interest legislation and protested that it was unfair for the entire nation to pay for the relief of a small group of backhauling farmers. All the country needed was more honesty and industriousness among the agricultural population. Moreover, such a plan would never pay for itself, and the nation would eventually have to pay off the foreign loan. Besides, the nation already had the Banco Nacional whose wise policies had resulted in a steadily declining interest rate since it was founded in 1842.\textsuperscript{41}

The solution to Venezuela’sills, the Conservators reiterated, was morality, industry, and prudence coupled with an energetic road program and increased encouragement to immigrants.

As the crisis which began in 1842 lingered on through 1843 and 1844, the discussion over these issues grew more and more strident, and the dividing line between money men and planters grew sharper. In the elections of 1844 the planter-dominates Liberal Party scored a number of triumphs at the polls which prompted them to present to Congress their plan for an agricultural bank. After much public controversy the Liberals forced a vote and passed the measure. But Conservative President Carlos Sucrevetted the bill and sent it back to Congress. Although the Liberals counted one vote more than the two-thirds needed to repass the measure over the presidential veto, the defection of two members of the Liberal majority allowed the Conservatives to defeat this sensible measure. Outraged Liberals, trying bribery, began laying plans for victory in the elections scheduled for 1846.\textsuperscript{51}

In the supercharged atmosphere fostered by the bitter legislative battles no one could hope for a peaceful election. Liberals, fighting in a campaign marred by violence and fraud, were severely handicapped by divisions within the party over the choice of a presidential candidate. Conservatives, united behind Páez’s choice, General José Tadeo Monagas, enjoyed all the advantages of controlling most public offices. Given such a situation it was not surprising that the Conservatives, by means of fraud and force, captured the presidency. With all avenues of peaceful conquest of power closed, desperate planters turned to armed rebellion in some of the richest agricultural districts of Venezuela. For most of 1846 and the first part of 1847 the outgoing Conservative administration of President Sucre had to chase down the rebels.\textsuperscript{52}

VENEZUELAN

Evidently the social and economic impact of the crisis and the economic recovery, the crop failures of 1846 and the recovery, continued to be marked by social and economic stresses. The coffee export industry, which had been in a recession for several years, was not as adversely affected as had been expected. The demand for coffee abroad remained strong, and the prices of coffee continued to rise. The exportation of coffee, which had declined in 1845, increased in 1846 and 1847. The coffee industry, which had been hit hard by the crop failures of 1845 and 1846, began to recover. The coffee trade with the United States, which had been declining, began to rise again. The coffee industry was one of the mainstays of the Venezuelan economy, and its recovery was an important indicator of the economic recovery of the country.
Evidently the desperation and strength of the Liberal rebels, as well as the social and economic prominence of some of the leaders, enlightened Monagas about the gravity of the depression. By late 1847, soon after taking office, Monagas cast himself loose from the political stewardship of Pizar and began to bring prominent Liberals into his administration. By January 1848 this shift to Liberal dominance was so complete that the Conservative caudillo, Pizar, rose in rebellion against the president he himself had elected.56

Although short-lived, the rebellion contributed one more blow to the already staggering economy. While the price depression continued to plague coffee growers, their peas were drafted by one side or the other to fight out the rebellion.57 Nor did the military defeat of Pizar to 1849 end the problem, because the conservative exiles kept up an unending stream of propaganda and subversion from the neighboring islands, always a haven for out-of-favor Venezuelan58.

Enjoying almost complete support from the planter elite, the Monagas government proceeded to pass into law much of the Liberal program. The major pieces of pro-creditor legislation such as the 10 de abril law were repulsed and replaced by more lenient credit arrangements. Unfortunately, the agricultural-credit bank failed to become a reality for lack of resources, and the only two commercial books in the country bidden in the early 1550's.

Thus the Liberal political triumph could not be transformed into economic recovery. Civil war and its attendant disorganization of agriculture, together with continued low coffee prices, prolonged the depression through the late 1848 and into the 1850's until 1858 when the long Federal War began. The lack of statistical information available during and after 1855 prevents any comparison of output levels: due to the massive dislocation and destruction, it is unlikely this coffee production reached levels much above those in 1850.60 Then a new golden age for Venezuelan coffee based on Andean production ensued; the analysis of this new boom and its political impact is beyond the scope of this article.
